B.Sc. in Computer Science & Engineering | Sylhet Engineering College | Graduated: 2026

CGPA: 3.75/4.00 (with distinction)

PROFESSIONAL SUMMARY

Full-stack developer who has taken a paid production system all the way from a blank Figma file to two years of live use — payments, OTP verification, server, and all. Comfortable across the stack: Next.js and React on the frontend, MySQL and API design on the backend, and Linux, Docker, and Traefik for the infrastructure that keeps it running. Also built a blockchain-based certificate verifier and a fairly large social app on the side, mostly to learn by building something bigger than a tutorial.

TECHNICAL SKILLS

Frontend & UI: Next.js (App Router), React, TypeScript, JavaScript, Tailwind CSS, shadcn/ui, HTML5, CSS3, Figma, responsive & accessible UI

Backend: Next.js Server Actions/API Routes, Node.js, REST APIs, WebSockets, authentication & authorization, RBAC

Databases: MySQL, PostgreSQL, MongoDB, Prisma ORM, Firebase, Convex, schema design & query optimization

DevOps: Linux, Ubuntu Server, CachyOS, SSH, Docker, Docker Compose, PM2, Traefik, GitHub Actions, VPS management

Cloud & Web: DigitalOcean, Hostinger KVM, Vercel, Cloudflare DNS/SSL/Turnstile, domain & subdomain management

Integrations: SSLCommerz, AlphaNet SMS, Email/SMS OTP, Google Authentication, blockchain verification, face recognition

FEATURED PROJECTS & ENGINEERING EXPERIENCE

Paid Project (Solo): SEC Central Admission Management Website

Lead Full-Stack Engineer & System Administrator | Sylhet Engineering College | 2024–Present | [Live](#) | [Case Study](#)

Architected and have maintained the college's central admission platform for two years now. **BDT 170,000** for the initial build, plus an ongoing annual contract for updates and support.

- Built the student-facing flow end to end: SSC/HSC roll and registration lookup against the college database, phone and email OTP verification, payment receipts, and self-service account recovery.
- Integrated SSLCommerz for online payments and AlphaNet for SMS notifications, with Cloudflare Turnstile to keep bot traffic out.
- Built the admin side from the ground up — seat planning, roll assignment, student record management, application/exam windows, and a live chat channel for student support.
- Handled data exports for result processing, attendance sheets, and room-wise exam statistics.
- Deployed on a DigitalOcean VPS in year one, then migrated everything to a Hostinger KVM4 VPS running Docker and Traefik in year two.
- Designed the UI in Figma before writing any code — this was my first paid project and I wanted it to look like one.

Hobby Project (Solo): Hive — Real-Time Social Media Platform Like Facebook

Frontend Developer | Personal / Learning Project | React & Firebase | [Live](#)

A Facebook-style social app built mainly to actually learn React properly, after starting with the official docs and a tic-tac-toe game. Covers auth, friend requests, posts with likes/comments/shares, real-time chat, and a couple of playable games with friends — bigger than anything I'd built before, but it works end to end.

Academic Project (Team): CertiChain — Blockchain Certificate Generation & Verification

Full-Stack Developer | Final Academic Project | 2026 | [Live](#)

Certificate issuance and verification platform for the college, with role-based access, face-recognition checks at verification time, and every certificate hash-anchored on-chain so it can't be quietly altered after issue.

More projects and case studies on my [portfolio](#).

ENGINEERING PROFILE

PRODUCT OWNERSHIP

Have taken a project from a client conversation and a Figma file through backend, deployment, and years of after-launch support.

PRODUCTION EXPERIENCE

Two years keeping a live system running for a real institution — patches, security updates, and support requests included.

INFRASTRUCTURE

Comfortable on the command line: Docker, Traefik, nginx, Cloudflare, SSH, DNS, and running several apps off one VPS.
